Legacy Lock

A Secure Continuity & Claim-Preparation Platform for
Financial and Digital Assets

Product & System Overview

What the platform does, how presence & claims are verified, and what it deliberately
will not do.

1 Executive Summary

“Aaj hum ek aisa product define karne wale hain jo kisi family ko emergency ya death ke baad apne loved one ki financial aur digital life discover karne ke liye mahino tak struggle nahi karne dega. Hum funds ko illegally transfer nahi karenge, passwords ko unsafe way mein share nahi karenge, aur AI ko legal authority nahi denge.”

— Founder, opening line to the team

Legacy Lock is a secure continuity and claim-preparation platform. It organizes a person’s financial and digital footprint into an encrypted vault, periodically confirms that person is still active, and – only when they stop responding and death is independently corroborated – guides an authorized nominee through a verified, institution-by-institution claim process.

It is deliberately *not* an automatic asset-transfer engine. The team’s core design principle is that **discovery and claim coordination is the real problem**, not moving money – because no third party can legally bypass a bank’s, insurer’s, or exchange’s own KYC and legal-heir process.

2 The Problem

2.1 A Real Scenario

Q Consider Arjun. His death is sudden. His family knows he likely had bank accounts, mutual funds, insurance, crypto, and cloud documents – but not which institutions, which account identifiers, whether nominees were even registered, or what the claim process requires. Every institution has its own KYC, documentation, and legal-heir rules; there is no universal portal that can move money on their behalf.

2.2 Problem Statement & Product Promise

Problem

People have financial and digital assets distributed across many services, but their families lack a secure, trusted, and organized way to discover those assets and follow the correct next steps when the person is unavailable.

Promise

Legacy Lock securely organizes your continuity plan, checks that you are active, and helps an authorized person prepare the right next steps if you cannot respond.

3 What Legacy Lock Is – and Is Not

What It Does

- ✓ Organizes assets, documents, and instructions into an encrypted vault
- ✓ Runs scheduled check-ins with safe, staged escalation
- ✓ Verifies nominee identity before any information is shared
- ✓ Builds an institution-specific claim-preparation checklist
- ✓ Requires human review before any sensitive release
- ✓ Logs every sensitive action for audit

What It Will Never Do

- ✗ Automatically transfer funds from any account
- ✗ Treat missed check-ins as final proof of death
- ✗ Let AI decide a nominee or legal heir
- ✗ Forward raw passwords, OTPs, or seed phrases
- ✗ Promise guaranteed regulatory approval or claim settlement
- ✗ Give AI legal authority over any decision

4 System Architecture: Four Modules

1. Encrypted Estate Vault

Where the user organizes asset information and documents into a structured, encrypted record – the single source of truth for what exists and where.

Owned by: Frontend & Backend Engineering

2. Presence & Safety Engine

Periodically confirms the user is active, and moves through a safe, staged escalation only when check-ins are missed.

Owned by: Automation/AI Engineering

3. Claim Workspace

Gives an authorized nominee or executor a guided, institution-by-institution checklist and verification path once escalation begins.

Owned by: Automation/AI & QA/Compliance

4. Release Governance

Decides who may see what, at which stage, and only after which approvals – enforcing scope, timing, and audit on every release.

Owned by: Backend/Security & QA/Compliance

In this architecture, **AI is an assistant, not an authority**. The key-management system manages encryption keys, but is not by itself a substitute for zero-knowledge design. A nominee is a role in the process, not an automatic beneficial owner.

5 Vault: Registration to Secure Storage

5.1 User Journey

1. **Account creation** – email/passkey sign-up with MFA; vault stays locked until passphrase setup is complete.
2. **Vault passphrase** – the user is warned this is critical. Keys are ideally derived on-device so the server never sees a plaintext passphrase. A recovery kit is generated for offline safekeeping.
3. **Guided onboarding checklist** – add a first asset, add a trusted person, set a check-in schedule, write emergency instructions, test recovery.
4. **Asset inventory** – categorized entries across bank/deposits, investments, insurance, crypto, cloud accounts, documents, loans, subscriptions, and personal instructions.

⚠ MVP boundary. Raw internet-banking passwords, OTPs, crypto private keys, and seed phrases are *not* collected. Instead the vault stores safer references: provider name, account hint, public wallet address, recovery arrangement, support URL, and a professional contact.

5.2 Data Flow & Encryption

An authorized user may see “Bank – HDFC – •••• 4812” in their own vault; an unauthorized nominee sees nothing until their role, record scope, release stage, and approval status all permit it.

5.3 Core Data Model

Entity	Example data
 User	User ID, email, authentication metadata, timezone
 VaultRecord	Category, encrypted payload, masked preview, last reviewed
 Document	Encrypted object path, type, checksum, retention date
 TrustedPerson	Name, contact, role, verification status
 ReleasePolicy	Trigger, grace period, approval rules, allowed scopes
 CheckIn	Date, channel, status, device/session metadata
 ClaimCase	Claimant, case status, evidence, assigned reviewer
 AuditEvent	Actor, action, timestamp, record scope, result
 JobEvent	Reminder/retry/event ID, status, processed timestamp

6 Presence & Safety: Check-in and Escalation

This system is a **continuity alert mechanism**, not a death detector – the distinction the whole team needs to hold onto.

6.1 Normal Flow

User sets a 30/60/90-day interval → system calculates the next check-in date → reminder sent by email/app/SMS → user confirms “I’m active” → timestamp and channel logged → next date calculated.

6.2 Missed Check-in Flow

1. First reminder sent.
2. Second reminder sent on an alternate channel.

3. Grace period begins.
4. User can cancel, pause, ask for more time, or confirm activity at any point.
5. After the grace period, the trusted contact receives only a *verification request*.
6. Claimant goes through identity verification and the document process.
7. High-risk cases route to manual human review.
8. Information is released strictly within the approved scope.

6.3 State Machine

⚠ Idempotency matters. Every transition needs an event ID, actor, timestamp, notification, retry behavior, audit event, and rollback path. If the same job runs twice, it must never send a duplicate reminder, open a duplicate claim case, or trigger a duplicate release.

7 Claim Workspace: Nominee & Claim Flow

- **Invitation:** contains no assets, balances, or sensitive data – only notice that a continuity case has started.
- **Identity verification:** name, government ID, relationship, and required documents; encrypted upload with OCR-assisted extraction, each field shown with a confidence level (e.g. “Name extracted with medium confidence – confirm or correct”).
- **Death certificate:** uploading starts a review – it does *not* trigger automatic release. The file is scanned, encrypted, OCR’d, and queued for manual review.
- **Claim dashboard:** institution-wise cards (bank, mutual fund, insurance, crypto exchange, digital account) each showing required documents, missing items, claim URL, contact, status, and next step.
- **Dossier:** AI places approved fields into a template – asset summary, masked identifiers, claimant info, document checklist, institution contacts, instructions, source links, reviewer notes, and disclaimer. Labelled “*Institution-specific claim-preparation dossier*” – never “*guaranteed claim dossier*”; each institution makes its own final decision.
- **Controlled release:** the exact scope is shown before release, and high-risk items require two-person approval, re-authentication, an expiring link, a watermark, a download limit, and an audit log entry.

Item	Status
Asset metadata	✓ Shared / ✗ Not shared
Claim checklist	✓ Shared / ✗ Not shared
Personal instructions	✓ Shared / ✗ Not shared
Identity documents	✓ Shared <i>after approval only</i>
Passwords / OTP / seed phrase	✗ Never shared by default

8 The Role of AI – Clearly Bounded

🔑 AI Does	🔑 AI Never Does
✓ OCR and structured field extraction ✓ Missing-document detection ✓ Institution-specific checklist suggestions ✓ Arranging approved information into dossier format	✗ Final certification of death ✗ Legal heir or nominee ownership decisions ✗ Automatic release approval ✗ Inventing legal citations or compelling institutions ✗ Declaring a document definitely genuine

9 Team & Build Roadmap

9.1 Roles & Responsibilities

Role	Name	Mission	First deliverable
Product Lead	TBD	Owns problem, scope, priorities, user stories, judge demo	PRD, MVP scope, acceptance criteria
UX/UI Designer	TBD	Converts screens into a coherent, premium design system	Design tokens, anchor screens, responsive flows
Frontend Engineer	TBD	Builds reusable, responsive, accessible product UI	App shell, routes, components, auth flow
Backend/Security Engineer	TBD	Keeps data, identity, permissions, encryption safe	Schema, API contract, auth, authorization, audit log
Automation/AI Engineer	TBD	Makes check-in, escalation, OCR, dossier pipeline reliable	State machine, jobs, notifications, AI contract
QA/Compliance/Trust Lead	TBD	Proves the product is safe, testable, non-misleading	Test plan, threat scenarios, compliance matrix

Team member names to be filled in.

9.2 Six-Phase Build Sequence

10 Judge Demo Script

- **Opening (20s):** “Families know that assets exist, but not where they are or how to claim them. Legacy Lock creates a secure continuity plan before a crisis happens.”
- **Dashboard (25s):** Continuity health, next check-in, vault completion, verified people, and documents needing review.
- **Vault Demo (30s):** Add a bank record; show the masked identifier, encrypted badge, nominee status, and claim guidance. Explain that raw passwords are never stored.
- **Check-in (20s):** Click “I’m active”; show the timestamp and next reminder.
- **Escalation (25s):** Show a simulated missed check-in timeline – reminder, grace period, verification, review – with “no final release has occurred” clearly visible.
- **Nominee Portal (35s):** Invitation, identity verification, death-certificate upload, and checklist.
- **AI Dossier (25s):** Extracted fields with confidence scores and a visible human-review requirement.
- **Controlled Release (20s):** Exact permission scope, two-person approval, expiring download, and audit log.
- **Closing (20s):** “Legacy Lock does not bypass institutions. It gives families a secure starting point, the correct documents, and a controlled path forward.”

Total run time: approx. 3 minutes 40 seconds across nine beats.

11 Decisions from This Meeting

Decision	Team’s direction
Product name	Legacy Lock
MVP scope	Vault, check-in, contacts, documents, checklist, audit
Excluded from MVP	Automatic transfer, raw passwords, seed phrases, unrestricted provider access
User roles	Owner, nominee, executor, professional reviewer, support, system worker
Release model	Staged, verified, human-reviewed, permission-scoped
Design source	Stitch plus shared design system
Primary logo	Light-themed redesigned asset
Backend/data architecture	<i>Still to be finalized</i> – database, storage, auth, key-management
AI output rule	Structured, confidence-labeled, human-reviewed
Demo data	100% synthetic
First milestone	Authentication + dashboard + vault shell

12 Closing Note

“Legacy Lock ka main feature sirf vault ya reminder nahi hai. Hamara main feature trust hai. User ko trust hona chahiye ki hum uski information unnecessarily nahi dekhenge. Nominee ko trust hona chahiye ki usse correct process milega. Judge ko trust hona chahiye ki product real-world constraints samajhta hai. Isliye hum flashy automatic transfer nahi, balki secure, verified, auditable aur human-controlled continuity experience build karenge.”
